

SN65518, SN75518

VACUUM FLUORESCENT DISPLAY DRIVERS

SLDS004B - MARCH 1983 - REVISED MAY 1990

- Each Device Drives 32 Lines
 - 60-V Output Voltage Swing Capability
 - 25-mA Output Source Current Capability
 - High-Speed Serially Shifted Data Input
 - Latches on All Driver Outputs

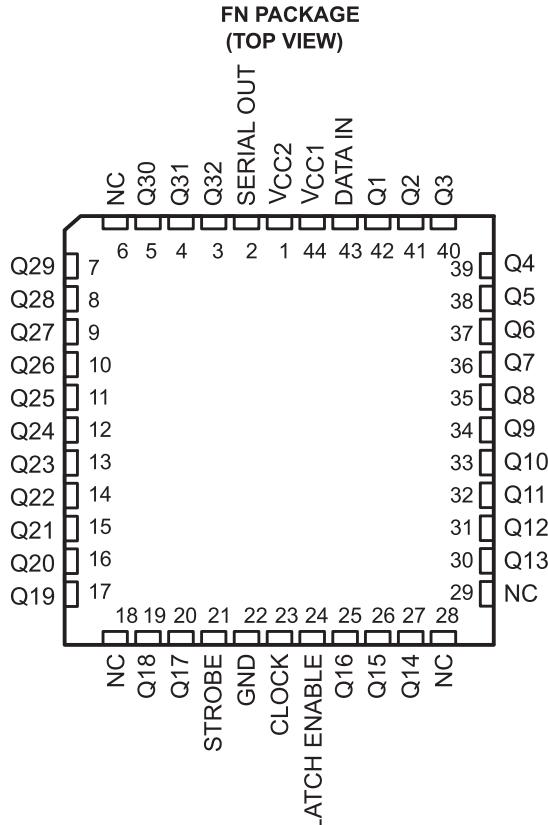

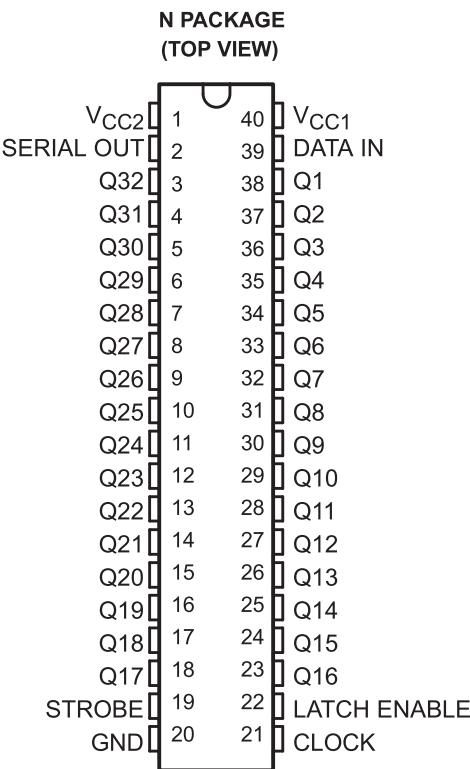

description

The SN65518 and SN75518 are monolithic BIDFET[†] integrated circuits designed to drive a dot matrix or segmented vacuum fluorescent display.

Each device consists of a 32-bit shift register, 32 latches, and 32 output AND gates. Serial data is entered into the shift register on the low-to-high transition of CLOCK. While LATCH ENABLE is high, parallel data is transferred to the output buffers through a 32-bit latch. Data present in the latch during the high-to-low transition of LATCH ENABLE is latched. When STROBE is low, all Q outputs are enabled. When STROBE is high, all Q outputs are low.

Serial data output from the shift register may be used to cascade additional devices. This output is not affected by LATCH ENABLE or STROBE.

The SN65518 is characterized for operation from -40°C to 85°C . The SN75518 is characterized for operation from 0°C to 70°C .

NC – No internal connection

[†]BIDFET – Bipolar, double-diffused, N-channel and P-channel MOS transistors on same chip. This is a patented process.

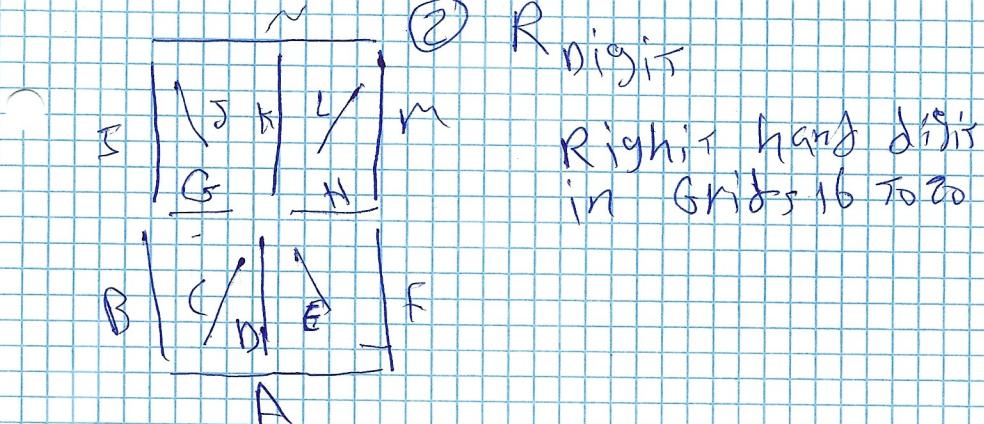

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.
